

IAM Design Decision

Purpose: Document the IAM design decisions for FinTrust employee, customer, and DevOps access patterns.

Decision Area	Design	Rationale
Employee Console Access (300 staff)	IAM Identity Center integrated with Active Directory	Employees authenticate with existing AD credentials and obtain AWS console access through SAML-based federation. No individual IAM users are created, simplifying lifecycle management and centralized SSO.
Customer Access (100,000 customers)	Cognito Identity Pool	Customer identities authenticate through the application and receive temporary STS credentials using AssumeRoleWithWebIdentity. Access is scoped to their own S3 data. No IAM users are required.
DevOps Administration	Permission Boundary on DevOps roles	Allows role creation for operational workloads while preventing privilege escalation. Effective permissions are limited to the intersection of the identity policy and the boundary.

Policy Evaluation Chain Diagram

Source Basis: IAM Identity Center for corporate AD users, Cognito Identity Pools for application users, Permission Boundaries for privilege-escalation prevention, and the IAM policy evaluation chain were derived from the supplied IAM Advanced training material.
